Tectonic Plates

Tectonic plates are giant slabs of rock that change Earth's surface. There are two types of tectonic plates. An oceanic tectonic plate and a continental tectonic plate. If you take the Earth apart using the tectonic plates as jigsaw puzzle pieces,

Tectonic Plates.
it's like a giant jigsaw puzzle.
Once a tectonic
did smash.

Volcanoes.

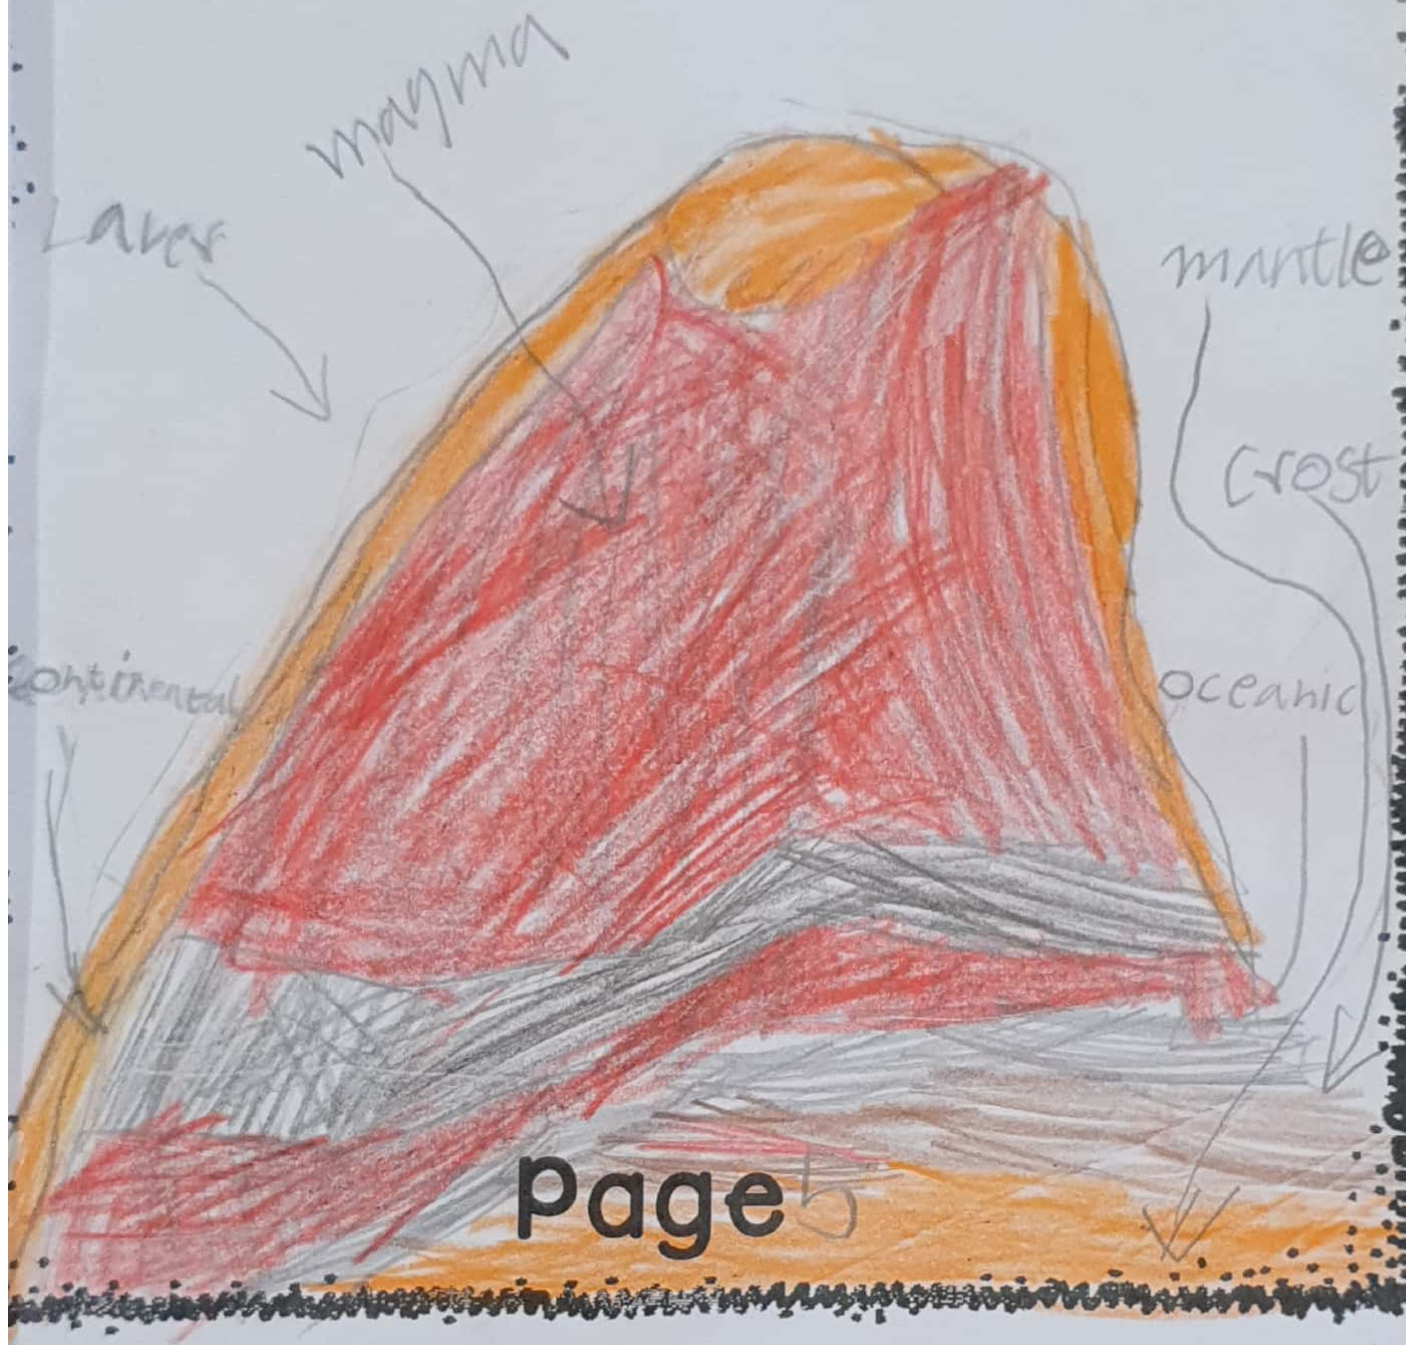

Volcanoes are made when a heavy oceanic plate collides with continental plate which is thicker. The oceanic plate sinks into the mantle. Hot magma burns through the bed rock.

Usually volcanoes are mountain. About a million years ago.

Volcanoes,
volcanoes were formed in the ring
of fire. Most volcanoes are
extinct. One of the most
deadly volcanoes is Mount
Vesuvius. When it exploded
poisonous gas came out. The
people from Pompeii
lived there because of the
rich soil.

Land Slides.

Land slides happen when

volcanoes and earthquakes

shake the the earth. Huge

chunks of earth and other

materials fall down a

mountain. Trees help stop

soil from falling. There is

such a thing called a mud

slide. It's when heaps of rain

comes and weakens the soil. It

Landslides.

Sometimes mudslides down a
mountain other times mudslides
down a hill.

Earthquakes.

Earthquakes happen when

any tectonic plate collides

with another tectonic plate.

They can be highly

dangerous. An earth is when
the earth shake and rumbles.

Buildings fall over and town

get destroyed. There are many

ways earthquake are made. Some

earthquakes happen under water.

Glossary

Words:

Definition:

Rambles

This word means a
sound coming under ground

Chunks

This is a word means big
parts or parts

Collides

This is a word when
something meet each other

Types

This is a word for two
things

I dedicate my book to

my ~~dad~~ because

he always pays attention
and he gives tips.
